DETAILED ACTION

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on November 28, 2005 has been entered.

Allowable Subject Matter

2. Claims 1-6, 9-11, 14 and 15 are allowed.

3. The following is an examiner's statement of reasons for allowance: the prior art of record fails to anticipate or render obvious an electromagnetic brake or actuator comprising a ringlike armature member having an axial length and arranged entirely radially outside of a ringlike core member along the entire axial length of the ringlike armature member, wherein the ringlike armature member has a second tapering surface complementary in shape to a first tapering surface of the ringlike core member, the second tapering surface being opposed to the first tapering surface, and having a first annular restriction member provided between the outer circumferential surface of the ringlike core member and the inner circumferential surface of the ringlike armature member at a position adjacent to the first and second tapering surfaces, the first annular restriction member being a ring and restricting radial movement of the ringlike armature member.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue

fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Paine, Timmis ('282) and Mesenich each teach an electromagnetic actuator having a ringlike armature arranged entirely outside of a ringlike core member. Timmis et al. ('132) teaches a ringlike armature member having a tapered surface complimentary to a tapered surface of a ringlike core member.
